Release Note EasySave

EasySave

Version 3.0

- Abandonment of the differential backup mode in favor of a parallel mode.

- Addition of file priorization. The user can now choose which files he wants to backup first by specifying the priority extensions. Any non-priority file will be saved if a priority file is under-goign.

- Addition of file size management. It is now impossible to transfer two files which size is greater than n Ko (defined as big files). As an optimization feature, the application can transfer one big file and multiple small files (files with a size under n Ko).

- Addition of backups management features :

    - Pause : the user can pause the backup after the transfer of the on-going file.

    - Play : the user can start or resume a backup.

    - Stop : the user can stop the backup and on-going work.

- Addition of an automatic break if a business software is detected as running

- Addition of a deported console to allow users to monitor the progress of the backups.

- Addition of a mono-instance mode. The application can now be launched only once. If the user tries to launch the application a second time, the first instance is brought to the foreground.

Version 2.0

- Addition of a graphic interface for the users.

- Deletion of the 5 Job limit. There is now no limit.

- Addition of a crypting software intergrated in the application.The software is CryptoSoft. Only the files with user specified extensions are encrypted.

- Addition of the encryption time in the daily log files.

- Addition of a system to detect a business software. If a business software is detected, it is impossible to launch a backup. For differential backups, the current backup is finished but the next one is not launched.

Version 1.1

- Addition of the XML format for daily logs files. The user can select the logs format in the settings menu. JSON format is instanced as default format.
